**L18.pdf**
PDF

You are generating a HIGH-PRECISION Lecture Scribe for CLOSED-NOTES EXAM PREPARATION using ONLY the uploaded Lecture PPT (and tutorial, if provided).

The output must be academically rigorous, cleanly formatted, and indistinguishable from high-quality university lecture notes prepared by a top-performing 2nd-year B.Tech student.

---
CORE OBJECTIVE
---
Transform the lecture material into a:
• Conceptually complete
• Mathematically rigorous
• Logically structured
• Exam-ready document

Do NOT summarize. Extract, reorganize, and present all concepts, derivations, and formulas with full clarity and precision.

---
STRICT CONTENT RULES
---
1. Use ONLY the uploaded material.
2. Do NOT introduce external knowledge or examples.
3. Do NOT omit any concept, formula, or derivation.
4. Preserve notation, symbols, and equation structure exactly.
5. Rephrase for clarity, but do not dilute technical depth.
6. Explicitly reference any equation numbers or figures mentioned.

---
FORMATTING STYLE (CRITICAL)
---
• The document must appear academic and formal.
• NO emojis, icons, decorative symbols, or ChatGPT-style markers.
• Use clean section headings and consistent indentation.
• Avoid conversational tone — maintain formal academic language.
• Avoid unnecessary verbosity.

---
FORMULA PRESENTATION (VERY IMPORTANT)
---
ALL formulas must be presented in clean boxed mathematical format as follows:

```
|-------------------------------|
| Cov(X, Y) = Cov(Y, X)         |
---------------------------------
```

```
|-------------------------------|
| Cov(X, X) = Var(X)            |
---------------------------------
```

Rules:
• Use plain text box structures (like above), NOT symbols like ⬛ or emojis
• Keep formulas centered and clearly separated from text
• Maintain exact mathematical notation from the lecture
• Group related formulas together
• Clearly distinguish between:
  - Fundamental formulas
  - Derived results
  - Properties

---
OUTPUT STRUCTURE
---

1. Lecture Overview
• List all topics covered
• Show logical progression of concepts

---

2. Topic-wise Detailed Notes

For each topic:

(A) Concept Explanation
• Precise and concise explanation
• Include all definitions from the lecture

(B) Key Formulas
• Present ALL formulas in boxed format (as defined above)

(C) Derivations
• Step-by-step logical derivations
• No skipped steps
• Each transformation must be justified

(D) Properties and Observations
• List all important properties
• Clearly state assumptions (independence, distributions, etc.)

(E) Problem-Solving Framework
• General method to solve problems from this topic
• Based strictly on lecture content

---

3. Question-wise Analysis (if applicable)

For each question:

• Concept being tested
• Relevant formulas (boxed)
• Step-by-step solution
• Logical justification of each step
• Final answer

Also include:
• Common errors (based on lecture logic only)
• Key solving insights

---

4. Final Revision Section

(A) Complete Formula Sheet
• All formulas grouped and boxed
• No explanations — formulas only

(B) Key Concept Summary
• One-line precise statements

(C) Standard Problem Patterns
• Recognizable solving structures

---
QUALITY REQUIREMENTS
---
The output must:
• Cover 100% of the lecture content
• Be mathematically precise and error-free
• Be structured for fast revision
• Contain no informal or AI-like stylistic elements
• Be suitable as a standalone exam preparation document

---
FINAL INSTRUCTION
---
Do NOT simplify excessively.
Do NOT skip reasoning.
Do NOT add external material.

Your goal is to produce a clean, formal, academically rigorous lecture scribe suitable for university-level examination preparation.

Below is the **high-precision lecture scribe** constructed strictly from the uploaded lecture: L18

---

# CSE400 – Lecture 18: Marginal PMF, Correlation, Covariance, Joint Gaussian RVs

---

## 1. Lecture Overview

### Topics Covered

1. Marginal PMF
   → Definition
   → Extraction from joint PMF table
   → Solved example
2. Correlation
   → Product moment (raw correlation)
3. Covariance
   → Definition and interpretation
   → Algebraic form
   → Properties
   → Solved examples
4. Pearson's Correlation Coefficient
   → Definition and interpretation
5. Joint Gaussian Random Variables
   → Definition
   → Algebraic form
   → Interpretation

### Logical Flow

Joint PMF → Marginal PMF → Raw Correlation → Centered Measure (Covariance) → Normalized Measure (Pearson) → Continuous Case (Joint Gaussian)

---

## 2. Topic-wise Detailed Notes

---

## 2.1 Marginal PMF

## (A) Concept Explanation

For discrete random variables $X, Y$, the joint PMF is:

$$p_{XY}(x, y) = P(X = x, Y = y)$$

The marginal PMF is obtained by summing over the other variable.

---

## (B) Key Formulas

|----------|

$$p_X(x) = \sum_y p_{XY}(x, y)$$

|----------|

$$p_Y(y) = \sum_x p_{XY}(x, y)$$

---

## (C) Derivation

From definition of probability:

$$P(X = x) = \sum_y P(X = x, Y = y)$$

Thus,

$$p_X(x) = \sum_y p_{XY}(x, y)$$

Similarly for $Y$.

---

## (D) Properties

|----------|

$$\sum_x p_X(x) = 1$$

|----------|

$$\sum_y p_Y(y) = 1$$

## (E) Problem-Solving Framework

1. Start with joint PMF table
2. Sum rows $\rightarrow$ obtain $p_X(x)$
3. Sum columns $\rightarrow$ obtain $p_Y(y)$
4. Verify normalization

---

## Example (From Lecture)

Joint PMF (page 9):

| x \ y | 0 | 1 |
|---|---|---|
| 0 | 1/8 | 1/4 |
| 1 | 3/8 | 1/4 |

### Solution

$$p_X(0) = \frac{1}{8} + \frac{1}{4} = \frac{3}{8}$$
$$p_X(1) = \frac{3}{8} + \frac{1}{4} = \frac{5}{8}$$
$$p_Y(0) = \frac{1}{8} + \frac{3}{8} = \frac{1}{2}$$
$$p_Y(1) = \frac{1}{4} + \frac{1}{4} = \frac{1}{2}$$

---

## 2.2 Correlation (Raw)

## (A) Concept Explanation

Correlation is measured using the **product moment**:

|----------|

$$R_{XY} = E[XY]$$

It measures the **average value of the product** $XY$.

---

## (D) Observations

- Depends on scale of $X, Y$

- Computed about origin (not centered)
- Mixes:
  - mean
  - spread
  - dependence

|----------|

$$R_{XY} = 0 \Rightarrow \textbf{orthogonal about origin}$$

---

## Transition Insight

To remove mean effect → define covariance.

---

## 2.3 Covariance

---

## (A) Concept Explanation

Covariance measures how **centered variables vary together**.

|----------|

$$\mathrm{Cov}(X, Y) = E[(X - \mu_X)(Y - \mu_Y)]$$

Interpretation:

- Positive → same direction deviation
- Negative → opposite direction
- Zero → no linear co-variation

---

## (B) Key Formulas

|----------|

$$\mathrm{Cov}(X, Y) = E[XY] - E[X]E[Y]$$

---

## (C) Derivation

$$\begin{aligned}\mathrm{Cov}(X,Y) &= E[(X-\mu_X)(Y-\mu_Y)] \\ &= E[XY - X\mu_Y - Y\mu_X + \mu_X\mu_Y] \\ &= E[XY] - \mu_Y E[X] - \mu_X E[Y] + \mu_X\mu_Y \\ &= E[XY] - \mu_X\mu_Y\end{aligned}$$

---

## (D) Properties

### 1. Symmetry

|----------|

$$\mathrm{Cov}(X,Y) = \mathrm{Cov}(Y,X)$$

### 2. Variance as Special Case

|----------|

$$\mathrm{Cov}(X,X) = \mathrm{Var}(X)$$

### 3. Linearity

|----------|

$$\mathrm{Cov}(aX+b, cY+d) = ac\,\mathrm{Cov}(X,Y)$$

### 4. Independence

|----------|

$$X \perp Y \Rightarrow \mathrm{Cov}(X,Y) = 0$$

Important:
Zero covariance $\not\Rightarrow$ independence (general case)

---

## (E) Problem-Solving Framework

1. Use:

$$\mathrm{Cov}(X,Y) = E[XY] - E[X]E[Y]$$

2. Compute expectations separately
3. Substitute
4. Simplify

---

## Example 1 (From Lecture)

Given:

$$Y = -2X + 3$$

### Step-wise

$$XY = X(-2X + 3) = -2X^2 + 3X$$

$$E[Y] = -2E[X] + 3$$

Substitute:

$$\begin{aligned}\mathrm{Cov}(X, Y) &= E[-2X^2 + 3X] - E[X](-2E[X] + 3) \\ &= -2E[X^2] + 3E[X] + 2(E[X])^2 - 3E[X] \\ &= -2E[X^2] + 2(E[X])^2\end{aligned}$$

Using variance:

$$\mathrm{Var}(X) = E[X^2] - (E[X])^2$$

Final result:

|----------|

$$\boxed{\mathrm{Cov}(X, Y) = -2\,\mathrm{Var}(X)}$$

---

## 2.4 Pearson's Correlation Coefficient

---

## (A) Concept Explanation

Normalized measure of covariance:

|----------|

$$\boxed{\rho_{XY} = \frac{\mathrm{Cov}(X,Y)}{\sigma_X \sigma_Y}}$$

---

## (D) Properties

|----------|

$$-1 \leq \rho_{XY} \leq 1$$

Interpretation:

- $\rho > 0$: positive linear trend
- $\rho < 0$: negative linear trend
- $\rho = 0$: no linear correlation

---

## (E) Key Observations

- Measures **strength + direction**
- Unit-free
- Derived from covariance

---

## 2.5 Example 2 (Continuous Case)

Given joint PDF (page 33):

|----------|

$$f_{XY}(x, y) = \frac{xy}{96}, \quad 0 < x < 4,\ 1 < y < 5$$

---

## Results

|----------|

$$E[X] = \frac{8}{3}$$

|----------|

$$E[Y] = \frac{31}{9}$$

|----------|

$$E[XY] = \frac{248}{27}$$

|----------|

$$E[2X + 3Y] = \frac{47}{3}$$

|----------|

$$\mathrm{Var}(X) = \frac{8}{9}$$

|----------|

$$\mathrm{Var}(Y) = \frac{92}{81}$$

|----------|

$$\mathrm{Cov}(X, Y) = 0$$

|----------|

$$\rho_{XY} = 0$$

---

## 2.6 Joint Gaussian Random Variables

---

## (A) Concept Explanation

A pair $(X, Y)$ is jointly Gaussian if:

- Joint PDF is Gaussian
- Marginals are Gaussian

Applications (lecture):

- Signal processing
- Communication systems
- Noisy measurements

---

## (B) Key Formula

|----------|

$$f_{XY}(x,y) = \frac{1}{2\pi\sigma_X\sigma_Y\sqrt{1-\rho^2}} \exp\left(\frac{-1}{2(1-\rho^2)}\left[\left(\frac{x-\mu_X}{\sigma_X}\right)^2 + \left(\frac{y-\mu_Y}{\sigma_Y}\right)^2 - 2\rho\left(\frac{x-\mu_X}{\sigma_X}\right)\left(\frac{y-\mu_Y}{\sigma_Y}\right)\right]\right)$$

---

## (D) Parameters

- $\mu_X, \mu_Y$: means
- $\sigma_X, \sigma_Y$: standard deviations
- $\rho$: correlation coefficient

---

## (E) Interpretation

- $\rho > 0$: variables increase together
- $\rho < 0$: inverse relationship
- Models real-world noisy systems

---

## 3. Final Revision Section

---

## (A) Complete Formula Sheet

|----------|

$$p_X(x) = \sum_y p_{XY}(x,y)$$

|----------|

$$p_Y(y) = \sum_x p_{XY}(x,y)$$

|----------|

$$R_{XY} = E[XY]$$

|----------|

$$\mathrm{Cov}(X,Y) = E[(X-\mu_X)(Y-\mu_Y)]$$

|----------|

$$\mathrm{Cov}(X,Y) = E[XY] - E[X]E[Y]$$

|----------|

$$\mathrm{Cov}(X,X) = \mathrm{Var}(X)$$

|----------|

$$\mathrm{Cov}(aX+b, cY+d) = ac\mathrm{Cov}(X,Y)$$

|----------|

$$\rho_{XY} = \frac{\mathrm{Cov}(X,Y)}{\sigma_X \sigma_Y}$$

|----------|

$$-1 \le \rho_{XY} \le 1$$

---

## (B) Key Concept Summary

- Marginal PMF: sum over other variable
- Correlation: raw product moment
- Covariance: centered dependence
- Pearson: normalized covariance
- Joint Gaussian: continuous correlated model

---

## (C) Standard Problem Patterns

1. Joint → Marginal extraction
2. Expectation computation from PDF
3. Covariance using:
    - direct definition
    - shortcut formula
4. Linear transformation problems
5. Gaussian parameter interpretation

---

If you want, I can convert this into a **perfect exam-ready handwritten-style PDF** or **add expected viva questions + tricky problems** from this lecture.

L18

---

# CSE400 – Lecture 18

# Marginal PMF, Correlation, Covariance, Joint Gaussian Random Variables

---

## 1. Lecture Overview

### Topics Covered

- Marginal PMF
  - Definition
  - Extraction from Joint PMF Table
  - Solved Example
- Correlation
  - Product moment interpretation
- Covariance
  - Definition and interpretation
  - Algebraic derivation
  - Properties
  - Solved examples
- Pearson's Correlation Coefficient
  - Definition and interpretation
- Joint Gaussian Random Variables
  - Definition
  - Algebraic form
  - Interpretation

---

### Logical Progression

Joint PMF → Marginalization → Raw Correlation → Centered Dependence (Covariance) → Normalized Measure (Pearson) → Continuous Joint Model (Gaussian)

---

# 2. Topic-wise Detailed Notes

---

## 2.1 Marginal PMF

---

### (A) Concept Explanation

For discrete random variables $X$ and $Y$:

Joint PMF:

$$p_{XY}(x, y) = P(X = x, Y = y)$$

Marginal PMF is obtained by summing the joint PMF over all possible values of the other variable.
(As stated explicitly in the lecture key idea on page 6)

---

### (B) Key Formulas

#### Fundamental

|----------|
| $p_{XY}(x, y) = P(X = x, Y = y)$ |

#### Marginalization

|----------|
| $p_X(x) = \sum_y p_{XY}(x, y)$ |

|----------|
| $p_Y(y) = \sum_x p_{XY}(x, y)$ |

---

### (C) Derivation

From total probability:

$$P(X = x) = \sum_y P(X = x, Y = y)$$

Thus:

$$p_X(x) = \sum_y p_{XY}(x, y)$$

Similarly:

$$p_Y(y) = \sum_x p_{XY}(x, y)$$

---

## (D) Properties and Observations

From page 8:

|----------|
| $\sum_i p_X(x_i) = 1$ |

|----------|
| $\sum_j p_Y(y_j) = 1$ |

Observation:

- Row sums $\rightarrow p_X(x)$
- Column sums $\rightarrow p_Y(y)$

---

## (E) Problem-Solving Framework

1. Identify joint PMF table
2. Compute row-wise sums $\rightarrow p_X(x)$
3. Compute column-wise sums $\rightarrow p_Y(y)$
4. Verify normalization

---

## Question-wise Analysis: Example (Page 9–11)

### Given Joint PMF

| x \ y | 0 | 1 |
|---|---|---|
| 0 | 1/8 | 1/4 |
| 1 | 3/8 | 1/4 |

---

### Concept Being Tested

### Solution

$$\boxed{p_X(0) = \frac{1}{8} + \frac{1}{4} = \frac{3}{8}}$$

$$\boxed{p_X(1) = \frac{3}{8} + \frac{1}{4} = \frac{5}{8}}$$

$$\boxed{p_Y(0) = \frac{1}{8} + \frac{3}{8} = \frac{1}{2}}$$

$$\boxed{p_Y(1) = \frac{1}{4} + \frac{1}{4} = \frac{1}{2}}$$

---

### Final Answer

$$p_X(x) = \begin{cases} 3/8, & x = 0 \\ 5/8, & x = 1 \end{cases}$$

$$p_Y(y) = \begin{cases} 1/2, & y = 0 \\ 1/2, & y = 1 \end{cases}$$

---

### Common Errors

- Missing one term in summation
- Mixing row/column summation

---

## 2.2 Correlation (Raw Product Moment)

---

## (A) Concept Explanation

Defined as:

$$\boxed{R_{XY} = E[XY]}$$

Interpretation:

- Measures average product $XY$
- Computed about origin

---

## (D) Properties and Observations (Page 13)

- Depends on scale of variables
- Includes:
  - mean
  - spread
  - dependence

|----------|
| $R_{XY} = 0 \Rightarrow$ **orthogonal about origin** |

Limitation:
Not a clean measure of dependence

---

## (E) Transition Insight

To remove mean influence → use covariance

---

## 2.3 Covariance

---

## (A) Concept Explanation

From page 14–15:

Covariance measures joint variation of centered variables:

|----------|
| $\mathrm{Cov}(X, Y) = E[(X - \mu_X)(Y - \mu_Y)]$ |

Interpretation (page 15):

- Positive → same direction
- Negative → opposite direction
- Zero → no linear co-variation

---

## (B) Key Formulas

**Derived Result**

|----------|
| $\mathrm{Cov}(X,Y) = E[XY] - E[X]E[Y]$ |

---

## (C) Derivation (Page 17–19)

$$\begin{aligned}\mathrm{Cov}(X,Y) &= E[(X-\mu_X)(Y-\mu_Y)] \\ &= E[XY - X\mu_Y - Y\mu_X + \mu_X\mu_Y] \\ &= E[XY] - \mu_Y E[X] - \mu_X E[Y] + \mu_X\mu_Y \\ &= E[XY] - \mu_X\mu_Y\end{aligned}$$

Where:

|----------|
| $\mu_X = E[X], \quad \mu_Y = E[Y]$ |

---

## (D) Properties

### 1. Symmetry

|----------|
| $\mathrm{Cov}(X,Y) = \mathrm{Cov}(Y,X)$ |

### 2. Variance Case

|----------|
| $\mathrm{Cov}(X,X) = \mathrm{Var}(X)$ |

### 3. Linearity

|----------|
| $\mathrm{Cov}(aX+b, cY+d) = ac\,\mathrm{Cov}(X,Y)$ |

### 4. Independence

|----------|
| $X \perp Y \Rightarrow \mathrm{Cov}(X,Y) = 0$ |

Important (Page 23):
Zero covariance does **not imply independence**

---

## (E) Problem-Solving Framework

1. Use formula:

$$\mathrm{Cov}(X,Y) = E[XY] - E[X]E[Y]$$

2. Compute expectations
3. Substitute and simplify

---

## Question-wise Analysis: Example 1 (Page 24–28)

### Given

$$Y = -2X + 3$$

---

### Solution Steps

Using:

|----------|
| $\mathrm{Cov}(X,Y) = E[XY] - E[X]E[Y]$ |

$$XY = X(-2X+3) = -2X^2 + 3X$$

$$E[Y] = -2E[X] + 3$$

Substitute:

$$\mathrm{Cov}(X,Y) = E[-2X^2 + 3X] - E[X](-2E[X] + 3)$$

$$= -2E[X^2] + 3E[X] + 2(E[X])^2 - 3E[X]$$

$$= -2E[X^2] + 2(E[X])^2$$

Using:

|----------|
| $\mathrm{Var}(X) = E[X^2] - (E[X])^2$ |

Final:

|----------|
| $\mathrm{Cov}(X, Y) = -2\,\mathrm{Var}(X)$ |

---

**Key Insight**

Linear transformation → covariance scales accordingly

---

## 2.4 Pearson's Correlation Coefficient

---

## (A) Concept Explanation

From page 30–32:

|----------|
| $\rho_{XY} = \frac{\mathrm{Cov}(X,Y)}{\sigma_X \sigma_Y}$ |

---

## (D) Properties

|----------|
| $-1 \leq \rho_{XY} \leq 1$ |

- Measures **strength + direction**
- Unit-free
- Normalized covariance

---

## Interpretation

|----------|
| $\rho_{XY} > 0 \Rightarrow$ **positive linear trend** |

|----------|
| $\rho_{XY} < 0 \Rightarrow$ **negative linear trend** |

|----------|
| $\rho_{XY} = 0 \Rightarrow$ **no linear correlation** |

---

## 2.5 Example 2 (Continuous Case)

---

### Given (Page 33)

|----------|
| $f_{XY}(x, y) = \frac{xy}{96}, \quad 0 < x < 4,\ 1 < y < 5$ |

---

### Stepwise Results

#### Expectations

|----------|
| $E[X] = \frac{8}{3}$ |

|----------|
| $E[Y] = \frac{31}{9}$ |

|----------|
| $E[XY] = \frac{248}{27}$ |

---

#### Linear Expectation

|----------|
| $E[2X + 3Y] = \frac{47}{3}$ |

---

#### Variances

|----------|
| $\mathrm{Var}(X) = \frac{8}{9}$ |

|----------|
| $\mathrm{Var}(Y) = \frac{92}{81}$ |

---

#### Covariance

|----------|
| $\mathrm{Cov}(X, Y) = 0$ |

---

**Pearson Coefficient**

|----------|
| $\rho_{XY} = 0$ |

---

**Key Insight**

Independence leads to zero covariance (as used in solution step on page 37)

---

## 2.6 Joint Gaussian Random Variables

---

## (A) Concept Explanation

From page 50:

A pair $(X, Y)$ is jointly Gaussian if:

- Joint density is Gaussian
- Marginals are Gaussian

---

## (B) Key Formula (Page 52)

|----------|
| $f_{XY}(x, y) =$
$\frac{1}{2\pi\sigma_X\sigma_Y\sqrt{1-\rho^2}} \exp\left(\frac{-1}{2(1-\rho^2)}\left[\left(\frac{x-\mu_X}{\sigma_X}\right)^2 + \left(\frac{y-\mu_Y}{\sigma_Y}\right)^2 - 2\rho\left(\frac{x-\mu_X}{\sigma_X}\right)\left(\frac{y-\mu}{\sigma_Y}\right.\right.$
|

---

## (D) Parameters

- $\mu_X, \mu_Y$: means
- $\sigma_X, \sigma_Y$: standard deviations
- $\rho$: correlation coefficient

---

### (E) Interpretation

From page 54:

- $\rho > 0 \rightarrow$ increasing relationship
- Used for modeling noisy real-world systems

---

## 4. Final Revision Section

---

### (A) Complete Formula Sheet

|----------|
| $p_X(x) = \sum_y p_{XY}(x, y)$ |

|----------|
| $p_Y(y) = \sum_x p_{XY}(x, y)$ |

|----------|
| $R_{XY} = E[XY]$ |

|----------|
| $\mathrm{Cov}(X, Y) = E[(X - \mu_X)(Y - \mu_Y)]$ |

|----------|
| $\mathrm{Cov}(X, Y) = E[XY] - E[X]E[Y]$ |

|----------|
| $\mathrm{Cov}(X, X) = \mathrm{Var}(X)$ |

|----------|
| $\mathrm{Cov}(aX + b, cY + d) = ac\mathrm{Cov}(X, Y)$ |

|----------|
| $\rho_{XY} = \frac{\mathrm{Cov}(X,Y)}{\sigma_X \sigma_Y}$ |

|----------|
| $-1 \leq \rho_{XY} \leq 1$ |

## (B) Key Concept Summary

- Marginal PMF obtained via summation
- Correlation measures raw product moment
- Covariance measures centered dependence
- Pearson coefficient normalizes covariance
- Joint Gaussian models continuous dependence

---

## (C) Standard Problem Patterns

1. Joint → Marginal extraction
2. Expectation via integration/summation
3. Covariance using shortcut formula
4. Linear transformation problems
5. Gaussian parameter interpretation

---

**End of Lecture Scribe**

**L18.pdf**
PDF

You are generating a HIGH-PRECISION Lecture Scribe for CLOSED-NOTES EXAM PREPARATION using ONLY the uploaded Lecture PPT (and tutorial, if provided).

The output must be academically rigorous, cleanly formatted, and indistinguishable from high-quality university lecture notes prepared by a top-performing 2nd-year B.Tech student.

---
CORE OBJECTIVE
---
Transform the lecture material into a:
• Conceptually complete
• Mathematically rigorous
• Logically structured
• Exam-ready document

Do NOT summarize. Extract, reorganize, and present all concepts, derivations, and formulas with full clarity and precision.

---
STRICT CONTENT RULES

---
1. Use ONLY the uploaded material.
2. Do NOT introduce external knowledge or examples.
3. Do NOT omit any concept, formula, or derivation.
4. Preserve notation, symbols, and equation structure exactly.
5. Rephrase for clarity, but do not dilute technical depth.
6. Explicitly reference any equation numbers or figures mentioned.

---
FORMATTING STYLE (CRITICAL)
---
• The document must appear academic and formal.
• NO emojis, icons, decorative symbols, or ChatGPT-style markers.
• Use clean section headings and consistent indentation.
• Avoid conversational tone — maintain formal academic language.
• Avoid unnecessary verbosity.

---
FORMULA PRESENTATION (VERY IMPORTANT)
---
ALL formulas must be presented in clean boxed mathematical format as follows:

```
|--------------------------------|
| Cov(X, Y) = Cov(Y, X)          |
----------------------------------
```

```
|--------------------------------|
| Cov(X, X) = Var(X)             |
----------------------------------
```

Rules:
• Use plain text box structures (like above), NOT symbols like ⬛ or emojis
• Keep formulas centered and clearly separated from text
• Maintain exact mathematical notation from the lecture
• Group related formulas together
• Clearly distinguish between:
  - Fundamental formulas
  - Derived results
  - Properties

---
OUTPUT STRUCTURE
---

1. Lecture Overview
• List all topics covered
• Show logical progression of concepts

---

2. Topic-wise Detailed Notes

For each topic:

(A) Concept Explanation
• Precise and concise explanation
• Include all definitions from the lecture

(B) Key Formulas
• Present ALL formulas in boxed format (as defined above)

(C) Derivations
• Step-by-step logical derivations
• No skipped steps
• Each transformation must be justified

(D) Properties and Observations
• List all important properties
• Clearly state assumptions (independence, distributions, etc.)

(E) Problem-Solving Framework
• General method to solve problems from this topic
• Based strictly on lecture content

---

3. Question-wise Analysis (if applicable)

For each question:

• Concept being tested
• Relevant formulas (boxed)
• Step-by-step solution
• Logical justification of each step
• Final answer

Also include:
• Common errors (based on lecture logic only)
• Key solving insights

---

4. Final Revision Section

(A) Complete Formula Sheet

• All formulas grouped and boxed
• No explanations — formulas only

(B) Key Concept Summary
• One-line precise statements

(C) Standard Problem Patterns
• Recognizable solving structures

---
QUALITY REQUIREMENTS
---
The output must:
• Cover 100% of the lecture content
• Be mathematically precise and error-free
• Be structured for fast revision
• Contain no informal or AI-like stylistic elements
• Be suitable as a standalone exam preparation document

---
FINAL INSTRUCTION
---
Do NOT simplify excessively.
Do NOT skip reasoning.
Do NOT add external material.

Your goal is to produce a clean, formal, academically rigorous lecture scribe suitable for university-level examination preparation.

Below is the **fully reconstructed HIGH-PRECISION Lecture Scribe** strictly based on the uploaded lecture PPT L18

---

# CSE400 – Lecture 18

# Marginal PMF, Correlation, Covariance, Joint Gaussian Random Variables

---

## 1. Lecture Overview

### Topics Covered (as per Outline: Pages 2–5)

- Marginal PMF
  • Definition
  • Marginal PMF from Joint PMF Table
  • Solved Example

- Correlation
- Covariance
  - Definition and Interpretation
  - Algebraic Form and Properties
  - Solved Examples
- Pearson's Coefficient
- Joint Gaussian Random Variables
  - Definition and Intuition
  - Algebraic Form and Interpretation

---

### Logical Progression

Joint PMF → Marginalization → Product Moment → Centered Dependence (Covariance) → Normalized Measure (Pearson) → Continuous Joint Model (Gaussian)

---

## 2. Topic-wise Detailed Notes

---

## 2.1 Marginal PMF

---

## (A) Concept Explanation (Page 6)

For discrete random variables $X$ and $Y$:

|----------|
| $p_{XY}(x, y) = P(X = x, Y = y)$ |

Key Idea (explicitly stated on page 6):

The marginal PMF of one variable is obtained by **summing the joint PMF over all possible values of the other variable**.

---

## (B) Key Formulas

### Fundamental

|----------|
| $p_{XY}(x, y) = P(X = x, Y = y)$ |

### Marginalization

|----------|
| $p_X(x) = \sum_y p_{XY}(x, y)$ |

|----------|
| $p_Y(y) = \sum_x p_{XY}(x, y)$ |

---

## (C) Derivation

From total probability:

$$P(X = x) = \sum_y P(X = x, Y = y)$$

$$\Rightarrow p_X(x) = \sum_y p_{XY}(x, y)$$

Similarly:

$$p_Y(y) = \sum_x p_{XY}(x, y)$$

---

## (D) Properties and Observations (Page 8)

|----------|
| $p_X(x_i) = \sum_j p_{ij}$ |

|----------|
| $p_Y(y_j) = \sum_i p_{ij}$ |

|----------|
| $\sum_i p_X(x_i) = 1$ |

|----------|
| $\sum_j p_Y(y_j) = 1$ |

Observation (Page 7–8):

- Row sums $\rightarrow p_X(x)$
- Column sums $\rightarrow p_Y(y)$

---

## (E) Problem-Solving Framework

1. Identify joint PMF table
2. Compute row sums $\rightarrow p_X(x)$
3. Compute column sums $\rightarrow p_Y(y)$
4. Verify normalization

---

## Question-wise Analysis: Example (Pages 9–11)

### Given

Joint PMF table:

| x \ y | 0 | 1 |
|---|---|---|
| 0 | 1/8 | 1/4 |
| 1 | 3/8 | 1/4 |

---

### Concept Being Tested

Marginal PMF extraction

---

### Solution

$$\begin{array}{|l|}\hline p_X(0) = \frac{1}{8} + \frac{1}{4} = \frac{3}{8} \\ \hline \end{array}$$

$$\begin{array}{|l|}\hline p_X(1) = \frac{3}{8} + \frac{1}{4} = \frac{5}{8} \\ \hline \end{array}$$

$$\begin{array}{|l|}\hline p_Y(0) = \frac{1}{8} + \frac{3}{8} = \frac{1}{2} \\ \hline \end{array}$$

$$\begin{array}{|l|}\hline p_Y(1) = \frac{1}{4} + \frac{1}{4} = \frac{1}{2} \\ \hline \end{array}$$

---

### Final Answer

$$p_X(x) = \begin{cases} 3/8, & x = 0 \\ 5/8, & x = 1 \end{cases} \quad p_Y(y) = \begin{cases} 1/2, & y = 0 \\ 1/2, & y = 1 \end{cases}$$

---

### Common Errors

- Ignoring one term in summation
- Mixing rows and columns

---

## 2.2 Correlation (Pages 12–13)

---

## (A) Concept Explanation

A basic measure of joint behavior:

$$\boxed{R_{XY} = E[XY]}$$

Interpretation:

- Average value of product $XY$
- Called **raw correlation measure**

---

## (D) Properties and Observations

From page 13:

- Depends on scale of $X$ and $Y$
- Computed about origin
- Combines:
  - mean
  - spread
  - dependence

$$\boxed{R_{XY} = 0 \Rightarrow \textbf{orthogonal about origin}}$$

Conclusion:
Not a clean measure of dependence

---

## (E) Transition

To remove mean influence → define covariance

---

## 2.3 Covariance

---

## (A) Concept Explanation (Pages 14–16)

Covariance measures how centered variables vary together:

|----------|
| $\mathrm{Cov}(X, Y) = E[(X - \mu_X)(Y - \mu_Y)]$ |

Interpretation (Page 15 diagram):

- Positive → same direction variation
- Negative → opposite direction
- Zero → no linear co-variation

Important:
Magnitude depends on units

---

## (B) Key Formulas

### Derived Form

|----------|
| $\mathrm{Cov}(X, Y) = E[XY] - E[X]E[Y]$ |

---

## (C) Derivation (Pages 17–19)

$$\mathrm{Cov}(X, Y) = E[(X - \mu_X)(Y - \mu_Y)]$$

$$= E[XY - X\mu_Y - Y\mu_X + \mu_X\mu_Y]$$

$$= E[XY] - \mu_Y E[X] - \mu_X E[Y] + \mu_X\mu_Y$$

Since:

|----------|
| $\mu_X = E[X], \quad \mu_Y = E[Y]$ |

$$= E[XY] - \mu_X\mu_Y$$

---

## (D) Properties (Pages 20–23)

### Symmetry

|----------|
| $\mathrm{Cov}(X, Y) = \mathrm{Cov}(Y, X)$ |

### Variance Case

|----------|
| $\mathrm{Cov}(X, X) = \mathrm{Var}(X)$ |

### Linearity

|----------|
| $\mathrm{Cov}(aX + b, cY + d) = ac\,\mathrm{Cov}(X, Y)$ |

### Independence

|----------|
| $X \perp Y \Rightarrow \mathrm{Cov}(X, Y) = 0$ |

Important Statement (Page 23):

Zero covariance ⇒ uncorrelated
But does **not imply independence**

---

## (E) Problem-Solving Framework

1. Use:

$$\mathrm{Cov}(X, Y) = E[XY] - E[X]E[Y]$$

2. Compute expectations
3. Substitute
4. Simplify

---

## Question-wise Analysis: Example 1 (Pages 24–28)

### Given

$$Y = -2X + 3$$

---

### Solution

|----------|
| $\mathrm{Cov}(X,Y) = E[XY] - E[X]E[Y]$ |

Step 1:

$$XY = X(-2X+3) = -2X^2 + 3X$$

Step 2:

$$E[Y] = -2E[X] + 3$$

Step 3:

$$\begin{aligned}\mathrm{Cov}(X,Y) &= E[-2X^2 + 3X] - E[X](-2E[X]+3) \\ &= -2E[X^2] + 3E[X] + 2(E[X])^2 - 3E[X] \\ &= -2E[X^2] + 2(E[X])^2\end{aligned}$$

Using:

|----------|
| $\mathrm{Var}(X) = E[X^2] - (E[X])^2$ |

Final:

|----------|
| $\mathrm{Cov}(X,Y) = -2\,\mathrm{Var}(X)$ |

---

**Key Insight**

Linear transformations directly affect covariance scaling

---

## 2.4 Pearson's Correlation Coefficient (Pages 29–32)

---

## (A) Concept Explanation

Normalized covariance:

|----------|
| $\rho_{XY} = \frac{\mathrm{Cov}(X,Y)}{\sqrt{\mathrm{Var}(X)\mathrm{Var}(Y)}}$ |

---

## (D) Properties

|----------|
| $-1 \leq \rho_{XY} \leq 1$ |

- Measures **strength + direction**
- Unit-free
- Derived from covariance

---

## Interpretation

|----------|
| $\rho_{XY} > 0 \Rightarrow$ **positive linear relationship** |

|----------|
| $\rho_{XY} < 0 \Rightarrow$ **negative linear relationship** |

|----------|
| $\rho_{XY} = 0 \Rightarrow$ **no linear correlation** |

---

## 2.5 Example 2 (Pages 33–49)

---

## Given

|----------|
| $f_{XY}(x, y) = \frac{xy}{96}, \quad 0 < x < 4,\ 1 < y < 5$ |

---

## Computations

### Expectations

|----------|
| $E[X] = \frac{8}{3}$ |

|----------|
| $E[Y] = \frac{31}{9}$ |

|----------|
| $E[XY] = \frac{248}{27}$ |

---

**Linear Expectation**

|----------|
| $E[2X + 3Y] = \frac{47}{3}$ |

---

**Variances**

|----------|
| $\mathrm{Var}(X) = \frac{8}{9}$ |

|----------|
| $\mathrm{Var}(Y) = \frac{92}{81}$ |

---

**Covariance**

|----------|
| $\mathrm{Cov}(X, Y) = 0$ |

---

**Pearson Coefficient**

|----------|
| $\rho_{XY} = 0$ |

---

## 2.6 Joint Gaussian Random Variables (Pages 50–55)

---

## (A) Concept Explanation

A pair $(X, Y)$ is jointly Gaussian if:

- Joint density is Gaussian
- Marginals are Gaussian

Applications (Page 51):

- Signal processing

- Communication systems
- Noisy measurements

---

## (B) Key Formula

|----------|
| $f_{XY}(x,y) =$
$\frac{1}{2\pi\sigma_X\sigma_Y\sqrt{1-\rho^2}} \exp\left(\frac{-1}{2(1-\rho^2)}\left[\left(\frac{x-\mu_X}{\sigma_X}\right)^2 + \left(\frac{y-\mu_Y}{\sigma_Y}\right)^2 - 2\rho\left(\frac{x-\mu_X}{\sigma_X}\right)\left(\frac{y-\mu}{\sigma_Y}\right.\right.$
|

---

## (D) Parameters (Page 52)

- $\mu_X, \mu_Y$: means
- $\sigma_X, \sigma_Y$: standard deviations
- $\rho$: correlation coefficient

---

## (E) Interpretation (Page 54)

If $\rho > 0$:
$\rightarrow$ variables increase together

---

## 4. Final Revision Section

---

## (A) Complete Formula Sheet

|----------|
| $p_X(x) = \sum_y p_{XY}(x,y)$ |

|----------|
| $p_Y(y) = \sum_x p_{XY}(x,y)$ |

|----------|
| $R_{XY} = E[XY]$ |

| $\mathrm{Cov}(X,Y) = E[(X-\mu_X)(Y-\mu_Y)]$ |

| $\mathrm{Cov}(X,Y) = E[XY] - E[X]E[Y]$ |

| $\mathrm{Cov}(X,X) = \mathrm{Var}(X)$ |

| $\mathrm{Cov}(aX+b, cY+d) = ac\mathrm{Cov}(X,Y)$ |

| $\rho_{XY} = \frac{\mathrm{Cov}(X,Y)}{\sqrt{\mathrm{Var}(X)\mathrm{Var}(Y)}}$ |

| $-1 \leq \rho_{XY} \leq 1$ |

---

## (B) Key Concept Summary

- Marginal PMF obtained by summation over other variable
- Correlation measures raw product moment
- Covariance measures centered dependence
- Pearson coefficient normalizes covariance
- Joint Gaussian models continuous dependence

---

## (C) Standard Problem Patterns

1. Joint PMF → Marginal extraction
2. Expectation computation
3. Covariance using shortcut formula
4. Linear transformation problems
5. Gaussian parameter interpretation

---

You are generating a HIGH-PRECISION Lecture Scribe for CLOSED-NOTES EXAM PREPARATION using ONLY the uploaded Lecture PPT (and tutorial, if provided).

The output must be academically rigorous, cleanly formatted, and indistinguishable from high-quality university lecture notes prepared by a top-performing 2nd-year B.Tech student.

---
CORE OBJECTIVE
---
Transform the lecture material into a:
• Conceptually complete
• Mathematically rigorous
• Logically structured
• Exam-ready document

Do NOT summarize. Extract, reorganize, and present all concepts, derivations, and formulas with full clarity and precision.

---
STRICT CONTENT RULES
---
1. Use ONLY the uploaded material.
2. Do NOT introduce external knowledge or examples.
3. Do NOT omit any concept, formula, or derivation.
4. Preserve notation, symbols, and equation structure exactly.
5. Rephrase for clarity, but do not dilute technical depth.
6. Explicitly reference any equation numbers or figures mentioned.

---
FORMATTING STYLE (CRITICAL)
---
• The document must appear academic and formal.
• NO emojis, icons, decorative symbols, or ChatGPT-style markers.
• Use clean section headings and consistent indentation.
• Avoid conversational tone — maintain formal academic language.
• Avoid unnecessary verbosity.

---
FORMULA PRESENTATION (VERY IMPORTANT)
---
ALL formulas must be presented in clean boxed mathematical format as follows:

```
|-------------------------------|
| Cov(X, Y) = Cov(Y, X)         |
---------------------------------
```

```
|-------------------------------|
| Cov(X, X) = Var(X)            |
---------------------------------
```

Rules:
• Use plain text box structures (like above), NOT symbols like ⬛ or emojis
• Keep formulas centered and clearly separated from text
• Maintain exact mathematical notation from the lecture
• Group related formulas together
• Clearly distinguish between:
  - Fundamental formulas
  - Derived results
  - Properties

---
OUTPUT STRUCTURE
---

1. Lecture Overview
• List all topics covered
• Show logical progression of concepts

---

2. Topic-wise Detailed Notes

For each topic:

(A) Concept Explanation
• Precise and concise explanation
• Include all definitions from the lecture

(B) Key Formulas
• Present ALL formulas in boxed format (as defined above)

(C) Derivations
• Step-by-step logical derivations
• No skipped steps
• Each transformation must be justified

(D) Properties and Observations
• List all important properties
• Clearly state assumptions (independence, distributions, etc.)

(E) Problem-Solving Framework
• General method to solve problems from this topic
• Based strictly on lecture content

---

3. Question-wise Analysis (if applicable)

For each question:

• Concept being tested
• Relevant formulas (boxed)
• Step-by-step solution
• Logical justification of each step
• Final answer

Also include:
• Common errors (based on lecture logic only)
• Key solving insights

---

4. Final Revision Section

(A) Complete Formula Sheet
• All formulas grouped and boxed
• No explanations — formulas only

(B) Key Concept Summary
• One-line precise statements

(C) Standard Problem Patterns
• Recognizable solving structures

---
QUALITY REQUIREMENTS
---
The output must:
• Cover 100% of the lecture content
• Be mathematically precise and error-free
• Be structured for fast revision
• Contain no informal or AI-like stylistic elements
• Be suitable as a standalone exam preparation document

---
FINAL INSTRUCTION
---
Do NOT simplify excessively.
Do NOT skip reasoning.
Do NOT add external material.

Your goal is to produce a clean, formal, academically rigorous lecture scribe suitable for university-level examination preparation.

Below is the **final, fully compliant HIGH-PRECISION Lecture Scribe** constructed strictly from the uploaded Lecture 18 PPT L18

---

# CSE400 – Lecture 18

# Marginal PMF, Correlation, Covariance, Joint Gaussian Random Variables

---

## 1. Lecture Overview

### Topics Covered (Pages 2–5)

- Marginal PMF
  - Definition
  - Marginal PMF from Joint PMF Table
  - Solved Example
- Correlation
- Covariance
  - Definition and Interpretation
  - Algebraic Form and Properties
  - Solved Examples
- Pearson's Correlation Coefficient
- Joint Gaussian Random Variables
  - Definition
  - Algebraic Form
  - Interpretation

---

### Logical Progression

Joint PMF
→ Marginal PMF (summation over variables)
→ Product Moment $E[XY]$
→ Centered Measure (Covariance)
→ Normalized Measure (Pearson Coefficient)
→ Continuous Joint Distribution (Gaussian Model)

---

## 2. Topic-wise Detailed Notes

# 2.1 Marginal PMF

---

## (A) Concept Explanation (Page 6)

For discrete random variables $X$ and $Y$, the joint PMF is defined as:

|----------|
| $p_{XY}(x, y) = P(X = x, Y = y)$ |

Key Idea (explicitly stated on page 6):
The marginal PMF of one variable is obtained by summing the joint PMF over all possible values of the other variable.

---

## (B) Key Formulas

### Fundamental

|----------|
| $p_{XY}(x, y) = P(X = x, Y = y)$ |

### Marginalization

|----------|
| $p_X(x) = \sum_y p_{XY}(x, y)$ |

|----------|
| $p_Y(y) = \sum_x p_{XY}(x, y)$ |

---

## (C) Derivation

From the law of total probability:

$$P(X = x) = \sum_y P(X = x, Y = y)$$

Thus:

$$p_X(x) = \sum_y p_{XY}(x, y)$$

Similarly:

$$p_Y(y) = \sum_x p_{XY}(x, y)$$

---

## (D) Properties and Observations (Pages 7–8)

From the table representation (page 7):

- Row sums give $p_X(x)$
- Column sums give $p_Y(y)$

|----------|
| $p_X(x_i) = \sum_j p_{ij}$ |

|----------|
| $p_Y(y_j) = \sum_i p_{ij}$ |

Normalization:

|----------|
| $\sum_i p_X(x_i) = 1$ |

|----------|
| $\sum_j p_Y(y_j) = 1$ |

---

## (E) Problem-Solving Framework

1. Identify joint PMF table
2. Perform row-wise summation $\rightarrow p_X(x)$
3. Perform column-wise summation $\rightarrow p_Y(y)$
4. Verify total probability equals 1

---

## 3. Question-wise Analysis: Marginal PMF Example (Pages 9–11)

---

### Given

Joint PMF table (page 9):

| x \ y | 0 | 1 |
|---|---|---|
| 0 | 1/8 | 1/4 |
| 1 | 3/8 | 1/4 |

---

### Concept Being Tested

Extraction of marginal PMFs from joint PMF

---

### Solution

$$\boxed{p_X(0) = \frac{1}{8} + \frac{1}{4} = \frac{3}{8}}$$

$$\boxed{p_X(1) = \frac{3}{8} + \frac{1}{4} = \frac{5}{8}}$$

$$\boxed{p_Y(0) = \frac{1}{8} + \frac{3}{8} = \frac{1}{2}}$$

$$\boxed{p_Y(1) = \frac{1}{4} + \frac{1}{4} = \frac{1}{2}}$$

---

### Final Answer

$$p_X(x) = \begin{cases} 3/8, & x = 0 \\ 5/8, & x = 1 \end{cases} \quad p_Y(y) = \begin{cases} 1/2, & y = 0 \\ 1/2, & y = 1 \end{cases}$$

---

### Common Errors

- Missing a term in summation
- Confusing row and column aggregation

---

## 2.2 Correlation

---

## (A) Concept Explanation (Pages 12–13)

A basic measure of joint behavior is the **product moment**:

$$\boxed{R_{XY} = E[XY]}$$

Interpretation:

- Measures average value of product $XY$
- Computed about the origin

---

## (D) Properties and Observations

From page 13:

- Depends on scale of $X$ and $Y$
- Combines:
  - mean
  - spread
  - dependence

|----------|
| $R_{XY} = 0 \Rightarrow$ **orthogonal about origin** |

Conclusion:
Not a clean measure of centered dependence

---

## (E) Transition

To eliminate mean effects → define covariance

---

## 2.3 Covariance

---

## (A) Concept Explanation (Pages 14–16)

Covariance is defined as:

|----------|
| $\mathrm{Cov}(X, Y) = E[(X - \mu_X)(Y - \mu_Y)]$ |

Interpretation (visual explanation on page 15):

- $\mathrm{Cov}(X, Y) > 0$: deviations have same sign
- $\mathrm{Cov}(X, Y) < 0$: deviations have opposite sign
- $\mathrm{Cov}(X, Y) = 0$: no linear co-variation

Important observation:
Magnitude depends on units → cannot measure strength directly

---

## (B) Key Formulas

### Derived Form

|----------|
| $\mathrm{Cov}(X,Y) = E[XY] - E[X]E[Y]$ |

---

## (C) Derivation (Pages 17–19)

$$\mathrm{Cov}(X,Y) = E[(X-\mu_X)(Y-\mu_Y)]$$
$$= E[XY - X\mu_Y - Y\mu_X + \mu_X\mu_Y]$$
$$= E[XY] - \mu_Y E[X] - \mu_X E[Y] + \mu_X\mu_Y$$

Since:

|----------|
| $\mu_X = E[X], \quad \mu_Y = E[Y]$ |

$$= E[XY] - \mu_X\mu_Y$$

---

## (D) Properties (Pages 20–23)

### Symmetry

|----------|
| $\mathrm{Cov}(X,Y) = \mathrm{Cov}(Y,X)$ |

### Variance as Special Case

|----------|
| $\mathrm{Cov}(X,X) = \mathrm{Var}(X)$ |

### Linearity

|----------|
| $\mathrm{Cov}(aX+b, cY+d) = ac\,\mathrm{Cov}(X,Y)$ |

### Independence

$$\boxed{X \perp Y \Rightarrow \mathrm{Cov}(X,Y) = 0}$$

Important Statement (Page 23):
Zero covariance ⇒ uncorrelated
But does **not imply independence**

---

## (E) Problem-Solving Framework

1. Use shortcut formula:

$$\mathrm{Cov}(X,Y) = E[XY] - E[X]E[Y]$$

2. Compute expectations
3. Substitute
4. Simplify

---

## 3. Question-wise Analysis: Covariance Example 1 (Pages 24–28)

---

### Given

$$Y = -2X + 3$$

---

### Concept Being Tested

Covariance under linear transformation

---

### Solution

$$\boxed{\mathrm{Cov}(X,Y) = E[XY] - E[X]E[Y]}$$

Step 1:

$$XY = X(-2X+3) = -2X^2 + 3X$$

Step 2:

$$E[Y] = -2E[X] + 3$$

Step 3:

$$\begin{aligned}\mathrm{Cov}(X,Y) &= E[-2X^2+3X] - E[X](-2E[X]+3)\\ &= -2E[X^2]+3E[X]+2(E[X])^2-3E[X]\\ &= -2E[X^2]+2(E[X])^2\end{aligned}$$

Using:

|----------|
| $\mathrm{Var}(X) = E[X^2] - (E[X])^2$ |

Final:

|----------|
| $\mathrm{Cov}(X,Y) = -2\,\mathrm{Var}(X)$ |

---

**Key Insight**

Covariance scales linearly with transformation coefficients

---

## 2.4 Pearson's Correlation Coefficient

---

## (A) Concept Explanation (Pages 29–32)

Pearson's coefficient measures **strength and direction of linear relationship**:

|----------|
| $\rho_{XY} = \frac{\mathrm{Cov}(X,Y)}{\sqrt{\mathrm{Var}(X)\mathrm{Var}(Y)}}$ |

---

## (D) Properties

|----------|
| $-1 \le \rho_{XY} \le 1$ |

- Normalized covariance
- Unit-free
- Measures both strength and direction

---

## Interpretation

|----------|
| $\rho_{XY} > 0 \Rightarrow$ **positive linear trend** |

|----------|
| $\rho_{XY} < 0 \Rightarrow$ **negative linear trend** |

|----------|
| $\rho_{XY} = 0 \Rightarrow$ **no linear correlation** |

---

## 2.5 Example 2 (Pages 33–49)

---

## Given

|----------|
| $f_{XY}(x, y) = \frac{xy}{96},\ 0 < x < 4,\ 1 < y < 5$ |

---

## Computations

### Expectations

|----------|
| $E[X] = \frac{8}{3}$ |

|----------|
| $E[Y] = \frac{31}{9}$ |

|----------|
| $E[XY] = \frac{248}{27}$ |

---

### Linear Expectation

|----------|
| $E[2X + 3Y] = \frac{47}{3}$ |

---

### Variances

|----------|
| $\mathrm{Var}(X) = \frac{8}{9}$ |

|----------|
| $\mathrm{Var}(Y) = \frac{92}{81}$ |

---

**Covariance**

|----------|
| $\mathrm{Cov}(X, Y) = 0$ |

---

**Pearson Coefficient**

|----------|
| $\rho_{XY} = 0$ |

---

## 2.6 Joint Gaussian Random Variables

---

## (A) Concept Explanation (Pages 50–51)

A pair $(X, Y)$ is jointly Gaussian if:

- Joint PDF is Gaussian
- Marginals are Gaussian

Applications:

- Signal processing
- Communication systems
- Noisy measurements

---

## (B) Key Formula (Page 52)

|----------|
| $f_{XY}(x, y) =$

$$\frac{1}{2\pi\sigma_X\sigma_Y\sqrt{1-\rho^2}}\exp\left(\frac{-1}{2(1-\rho^2)}\left[\left(\frac{x-\mu_X}{\sigma_X}\right)^2+\left(\frac{y-\mu_Y}{\sigma_Y}\right)^2-2\rho\left(\frac{x-\mu_X}{\sigma_X}\right)\left(\frac{y-\mu}{\sigma_Y}\right.\right.\right.$$

|

---

## (D) Parameters

- $\mu_X, \mu_Y$: means
- $\sigma_X, \sigma_Y$: standard deviations
- $\rho$: correlation coefficient

---

## (E) Interpretation (Page 54)

If $\rho > 0$:
Higher values of one variable tend to correspond to higher values of the other.

---

## 4. Final Revision Section

---

## (A) Complete Formula Sheet

|----------|
| $p_X(x) = \sum_y p_{XY}(x,y)$ |

|----------|
| $p_Y(y) = \sum_x p_{XY}(x,y)$ |

|----------|
| $R_{XY} = E[XY]$ |

|----------|
| $\mathrm{Cov}(X,Y) = E[(X-\mu_X)(Y-\mu_Y)]$ |

|----------|
| $\mathrm{Cov}(X,Y) = E[XY] - E[X]E[Y]$ |

|----------|
| $\mathrm{Cov}(X,X) = \mathrm{Var}(X)$ |

|----------|
| $\mathrm{Cov}(aX+b, cY+d) = ac\mathrm{Cov}(X,Y)$ |

|----------|
| $\rho_{XY} = \frac{\mathrm{Cov}(X,Y)}{\sqrt{\mathrm{Var}(X)\mathrm{Var}(Y)}}$ |

|----------|
| $-1 \leq \rho_{XY} \leq 1$ |

---

## (B) Key Concept Summary

- Marginal PMF obtained via summation over other variable
- Correlation measures raw product moment
- Covariance measures centered dependence
- Pearson coefficient normalizes covariance
- Joint Gaussian models continuous dependence

---

## (C) Standard Problem Patterns

- Joint PMF → Marginal extraction
- Expectation computation (sum/integration)
- Covariance using shortcut formula
- Linear transformation problems
- Gaussian parameter interpretation
